What is Cucumber & Gherkin

- **Cucumber** is a testing tool that supports Behavior Driven Development
- It defines application behaviors/features using simple «English» text, defined by a language called **Gherkin**
- It allows automation functional validation that is easily read and understood.
- Initially implemented in Ruby and then extended to Java.

How does it work?

- We specify **expected behavior** by defining **features and scenarios**.
- The **feature** describes (part of) a feature of your application.
- The **scenarios** describe different ways users can use this feature.
- The **scenarios** consists of a list of **steps**.
- The **steps** are matched to **step definitions**, which map the plain text steps to programming code
- The plain text steps are defined in the **Gherkin** language.
- **Gherkin** allows *developers and business stakeholders to describe and share the expected behaviour of the application* and should not describe the implementation.

How does it work?

A simple feature file consists of the following keywords / parts

- **Feature** – Name of the feature under test.
- **Description** (optional) – Describe about feature under test.
- **Scenario** – What is the test scenario.
- **Given** – Prerequisite before the test steps get executed.
- **When** – Specific condition which should match in order to execute the next step.
- **Then** – What should happen
- **AND** - conjunction between conditions. **AND** can be used with any other keywords like **GIVEN**, **WHEN** and **THEN**.

Example: Feature specified with Cucumber / Gherkin

Feature: Stock Portfolio

Optional Manage a stock portfolio and print current state

Scenario:

Given I bought 1000 shares of "Old School Waterfall Software LTD" on "14/02/1990"

And I bought 400 shares of "Crafter Masters Limited" on "09/06/2016"

And I bought 700 shares of "XP Practitioners Incorporated" on "10/12/2018"

And I sold 500 shares of "Old School Waterfall Software LTD" on "11/12/2018"

And the current share value of "Old School Waterfall Software LTD" is \$5.75

And the current share value of "Crafter Masters Limited" is \$17.25

And the current share value of "XP Practitioners Incorporated" is \$25.55

When I print my current portfolio

Then the outcome displayed should be:

"""

company	shares	current price	current value	last operation
---------	--------	---------------	---------------	----------------

Crafter Masters Limited	400	\$17.25	\$6'900.00	sold 400 on 09/06/2016
-------------------------	-----	---------	------------	------------------------

Old School Waterfall Software LTD	500	\$5.75	\$2'875.00	sold 500 on 11/12/2018
-----------------------------------	-----	--------	------------	------------------------

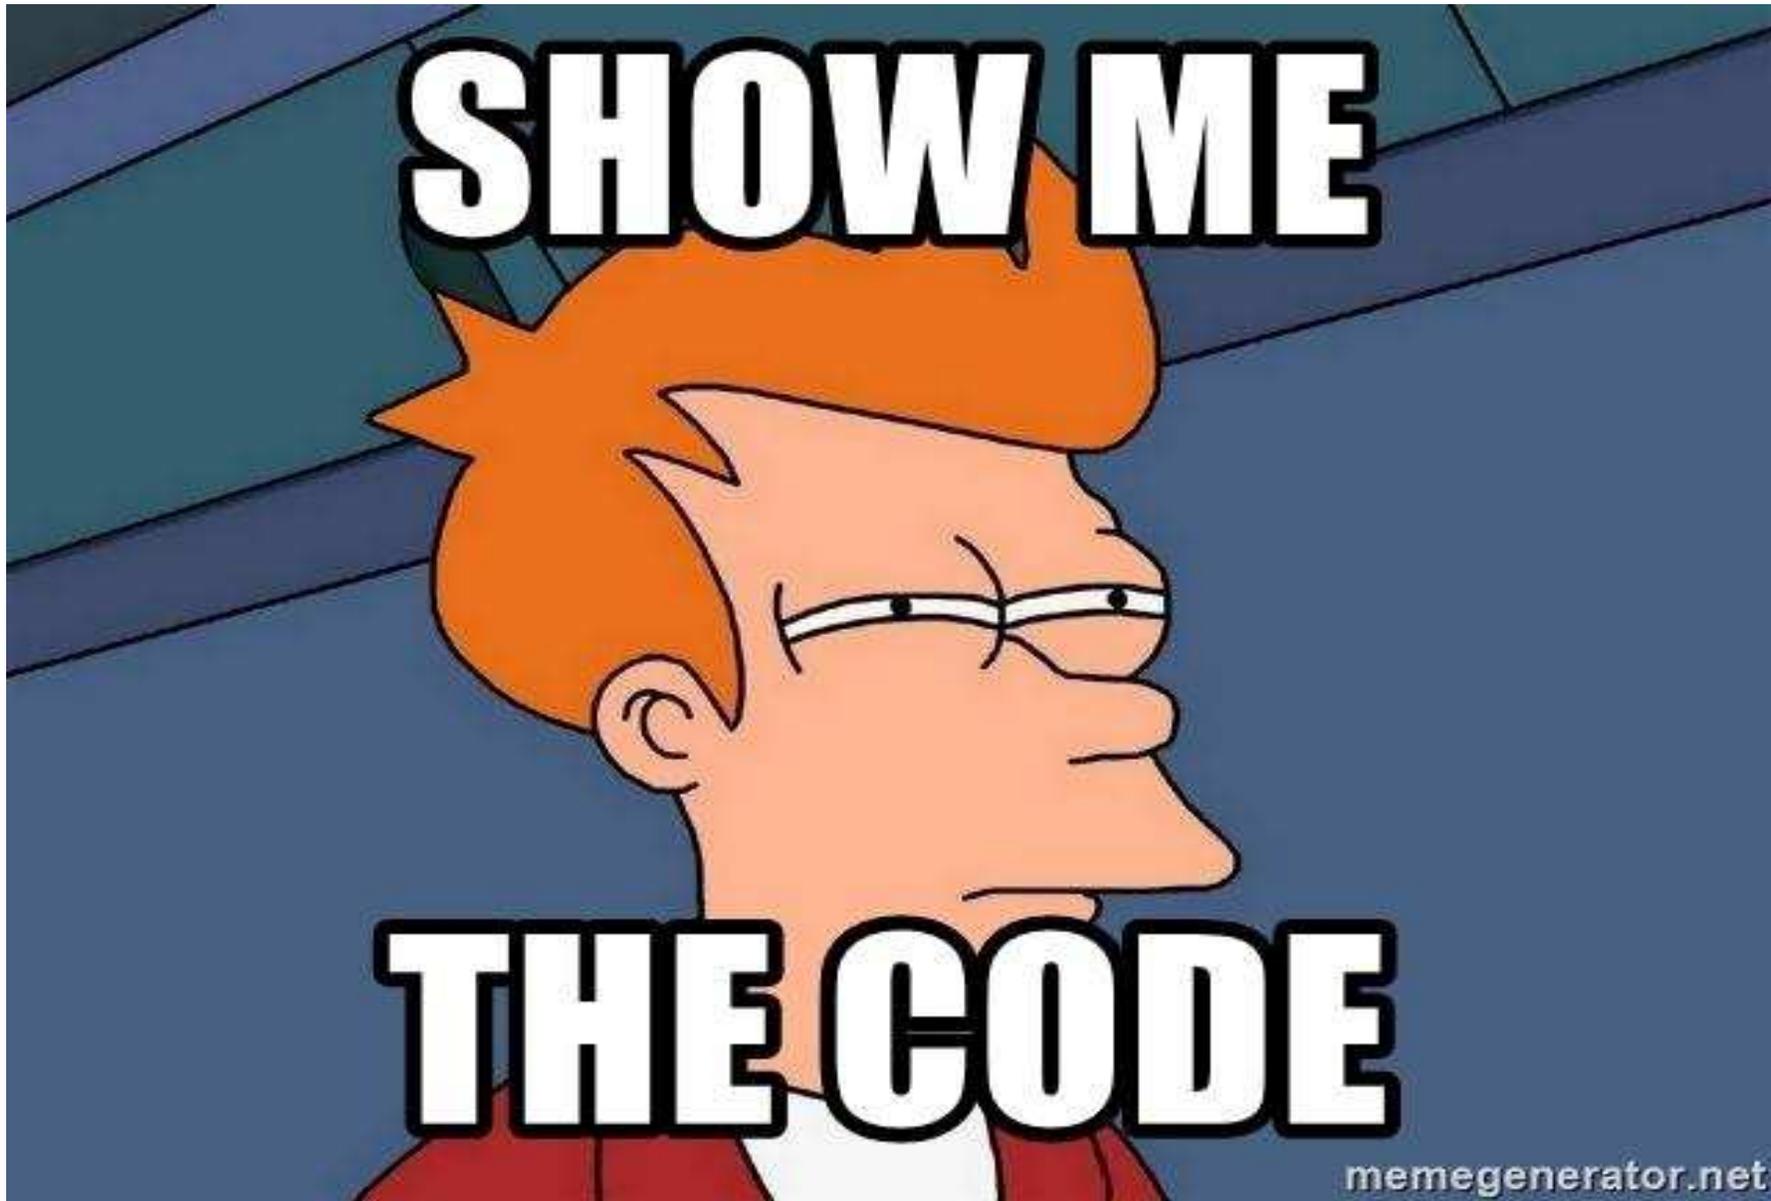

XP Practitioners Incorporated	700	\$25.55	\$17'885.00	sold 700 on 10/12/2018
-------------------------------	-----	---------	-------------	------------------------

"""

Example: Feature specified with Cucumber / Gherkin

given I bought 1000 shares of "Old School Waterfall Software LTD" on 14/02/1990
and I bought 400 shares of "Crafter Masters Limited" on 09/06/2016
and I bought 700 shares of "XP Practitioners Incorporated" on 10/12/2018
and I sold 500 shares of "Old School Waterfall Software LTD" on 11/12/2018
and the current share value of "Old School Waterfall Software LTD" is \$5.75
and the current share value of "Crafter Masters Limited" is \$17.25
and the current share value of "XP Practitioners Incorporated" is \$25.55
when I print my current portfolio
then the outcome displayed should be:

company	shares	current price	current value	last operation
Old School Waterfall Software LTD	500	\$5.75	\$2,875.00	sold 500 on 11/12/2018
Crafter Masters Limited	400	\$17.25	\$6,900.00	bought 400 on 09/06/2016
XP Practitioners Incorporated	700	\$25.55	\$17,885.00	bought 700 on 10/12/2018
