

# Architecture Tests

Philip Baumann

# Architecture Tests

- Different Kind of tests
- Behaviour oriented
- None of them tests our design
- Set of Rules

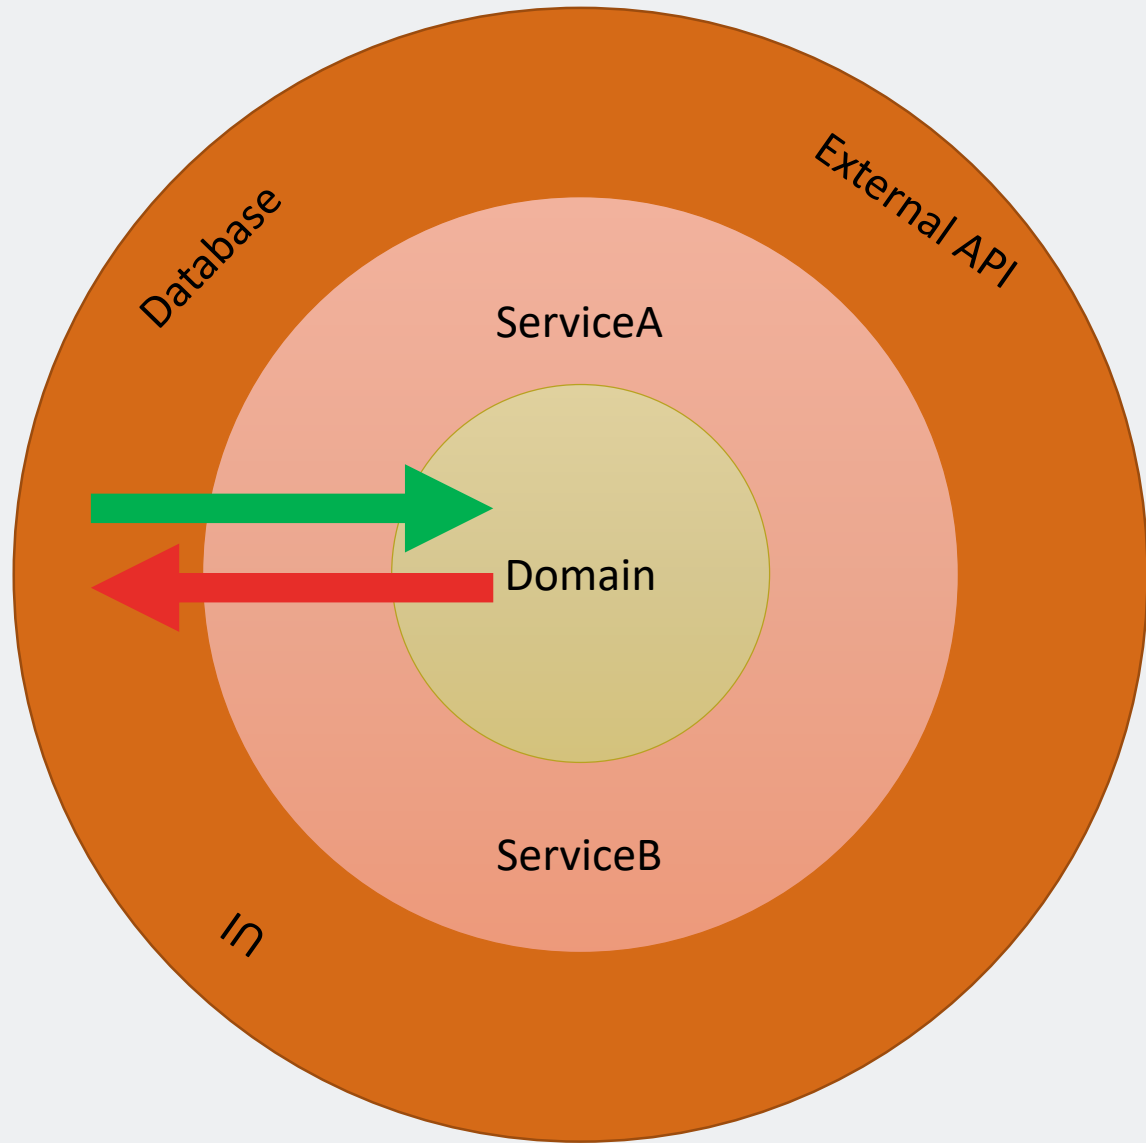

# Testing Architecture

- Evolution of a project
- Fix a bug  $\neq$  Fix design
- Guideline for employees

# Use Case Test Naming

```
● ● ●  
  
@Test  
void should_make_sure_that_tests_start_with_should_and_dont_end_with_test_in_name() {  
    final JavaClasses importedClasses =  
        new ClassFileImporter().importPackages("my.special.package");  
    final ArchRule methodsStartingWithShould = methods()  
        .that()  
        .areAnnotatedWith(Test.class)  
        .should()  
        .haveNameStartingWith("should")  
        .andShould()  
        .haveNameNotEndingWith("test")  
        .because("We decided that this is our naming convention");  
  
    methodsStartingWithShould.check(importedClasses);  
}
```

# Use Case

```
● ● ●  
  
@Test  
public void onion_architecture_is_respected() {  
    final JavaClasses classes = new ClassFileImporter().importPackages("my.special.package");  
  
    onionArchitecture()  
        .domainModels("..domain.model..")  
        .domainServices("..domain.service..")  
        .applicationServices("..application..")  
        .adapter("persistence", "..adapter.persistence..")  
        .adapter("controller", "..adapter.controller..")  
        .check(classes);  
}
```

# Conclusion

- One time thing
- No Guarantee
- Fluent coding
- Very easy to learn
- Powerful

# Thank You

Philip Baumann
